

# $Z$ -boson pair + 1-jet production at NLO QCD

Nikolas Kauer

Royal Holloway, University of London

in collaboration with

Jennifer Archibald, Thomas Binoth, Tanju Gleisberg, Stefan Karg, Grégory Sanguinetti

HP<sup>2</sup> High Precision for Hard Processes at the LHC Workshop

Galileo Galilei Institute for Theoretical Physics, Florence, Italy

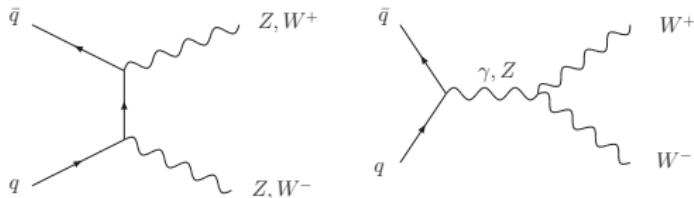

September 14, 2010

# Outline

- Weak boson pair (+ jets) production
- Weak bosons: importance for LHC physics
- NLO QCD calculation for  $ZZ + \text{jet}$
- Calculational details
- Tuned comparison with DKU's calculation
- Results
- Summary

# Predictions for weak boson pair production

- $e^+e^-, pp, p\bar{p} \rightarrow ZZ, WW$  at LO (and decays)

Brown, Mikaelian (1979); Stirling, Kleiss, S. Ellis (1985); Gunion, Kunszt (1986); Muta, Najima, Wakaizumi (1986); Berends, Kleiss, Pittau (1994) [ $e^+e^- \rightarrow f_1\bar{f}_2f_3\bar{f}_4$  at LO]

- $pp, p\bar{p} \rightarrow ZZ, WW, WZ$  at NLO QCD (with leptonic decays)

Ohnemus (1991); Mele, Nason, Ridolfi (1991); Ohnemus, Owens (1991); Frixione (1993); Ohnemus (1994); Dixon, Kunszt, Signer (1998, 1999); Campbell, K. Ellis (1999) [ $pp, p\bar{p} \rightarrow \ell\bar{\ell}\ell'\bar{\ell}'$  at NLO QCD]

- $gg \rightarrow ZZ, WW$  (with leptonic decays), (1-loop)<sup>2</sup> NNLO QCD correction  
Dicus, Kao, Repko (1987); Glover, van der Bij (1989); Kao, Dicus (1991); Matsuura, v.d. Bij (1991); Zecher, Matsuura, v.d. Bij (1994); Dührssen, Jakobs, v.d. Bij, Marquard (2005); Bineth, Ciccolini, NK, Krämer (2005, 2006); Bineth, NK, Mertsch (2008)
- 2-loop-virtual–Born interference for  $q\bar{q} \rightarrow WW \rightarrow$  NNLO QCD correction  
Chachamis, Czakon, Eiras (2008)

## Predictions for weak boson pair + jets production

- $pp, p\bar{p} \rightarrow ZZ, WW + \text{jet}$  at NLO QCD (with leptonic decays)  
Dittmaier, Kallweit, Uwer (2007); Campbell, K. Ellis, Zanderighi (2007); Bineth, Gleisberg, Karg, NK, Sanguinetti (2009)
- Weak boson fusion contribution to  $pp \rightarrow WW + 2 \text{ jets}, ZZ + 2 \text{ jets}, WZ + 2 \text{ jets}$  at NLO QCD with leptonic decays  
B. Jäger, Oleari, Zeppenfeld (2006); Bozzi, B. Jäger, Oleari, Zeppenfeld (2007)

comprehensive list of references → e.g. arXiv:0911.3181 [hep-ph]

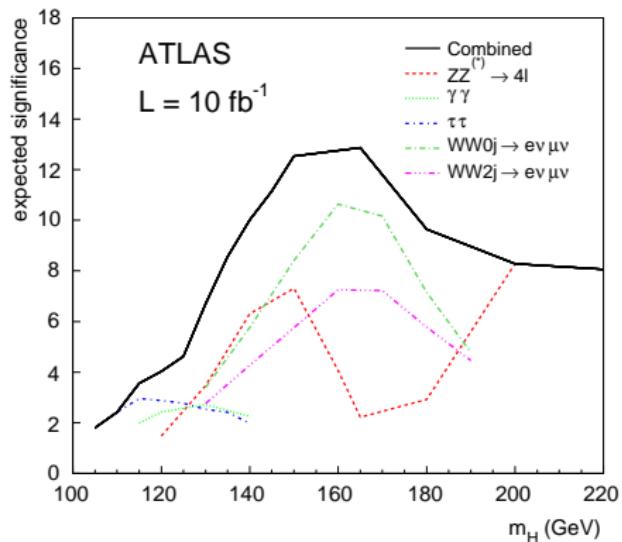

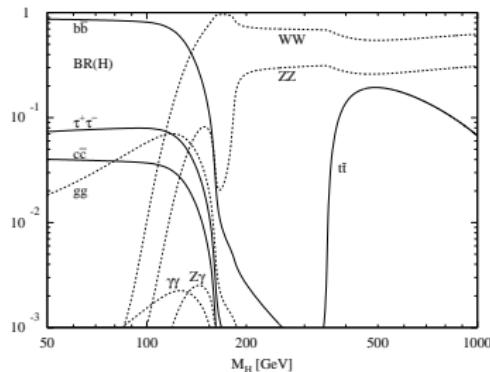

# Weak bosons: importance for LHC physics

## LHC search for New Physics (SUSY, ...)

- ▶ dark matter candidate → signatures with  $\cancel{E}_T$
- ▶ cascade decays with new EW gauge bosons/gauginos →  $\ell^\mp$
- ▶ cascade decays of new coloured particles → jets

$W, Z$  decay into  $\ell^\mp$  and/or  $\nu$  or jets → same signatures → important backgrounds

## LHC search for SM & BSM Higgs

$H \rightarrow VV$  searches: dominant irreducible background is  $VV$  (+ jets)

# Updated experimenter's wishlist for LHC processes

Process ( $V \in \{Z, W, \gamma\}$ )	Comments
Calculations completed since Les Houches 2005	
1. $pp \rightarrow VV\text{jet}$	$WW\text{jet}$ completed by Dittmaier/Kallweit/Uwer; Campbell/Ellis/Zanderighi. $ZZ\text{jet}$ completed by Binoth/Gleisberg/Karg/NK/Sanguinetti.
2. $pp \rightarrow \text{Higgs+2jets}$	NLO QCD to the $gg$ channel completed by Campbell/Ellis/Zanderighi; NLO QCD+EW to the VBF channel completed by Ciccolini/Denner/Dittmaier
3. $pp \rightarrow VVV$	$ZZZ$ completed by Lazopoulos/Melnikov/Petriello and $WWZ$ by Hankele/Zeppenfeld (see also Binoth/Ossola/Papadopoulos/Pittau)
4. $pp \rightarrow t\bar{t} b\bar{b}$	relevant for $t\bar{t}H$ computed by Bredenstein/Denner/Dittmaier/Pozzorini and Bevilacqua/Czakon/Papadopoulos/Pittau/Worek
5. $pp \rightarrow V+3\text{jets}$	calculated by the Blackhat/Sherpa and Rocket collaborations

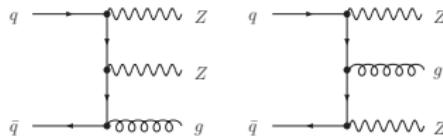

# NLO QCD calculation for $ZZ + \text{jet}$

$H/\text{NP}$  background,  $ZZ + \text{jet}$  @ NLO: component of  $ZZ$  @ NNLO, anomalous couplings searches

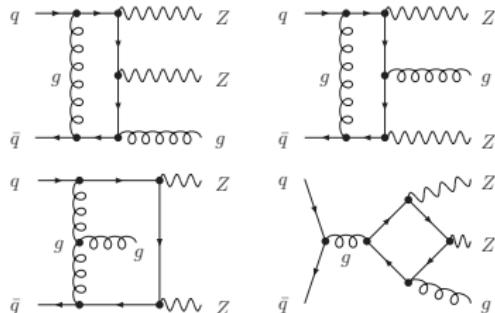

(no  $ZZ\gamma$  or  $ZZZ$  coupling in SM)

6 subprocesses:  $q\bar{q} \rightarrow ZZg$ ,  $qg \rightarrow ZZq$ ,  $\bar{q}g \rightarrow ZZ\bar{q}$  with  $q = u, c, d, s, b$

## LO amplitude contributions

## Virtual corrections contributions

Real corrections: crossings of  $0 \rightarrow ZZq\bar{q}gg$  and  $0 \rightarrow ZZq\bar{q}q'\bar{q}'$

# Calculational details

Archibald, Binoth, Gleisberg, Karg, NK, Sanguinetti

**Virtual correction:** GOLEM tensor reduction approach

Binoth, Heinrich (2004); Binoth, Guillet, Heinrich, Pilon, Schubert (2005)

6 distinct subprocesses ( $u,d$  sep.),  $\sim 200$  Feynman graphs, 36 helicity combinations, 't Hooft-Veltman and MS schemes

**2→3 status:** complete and cross checked

**Real correction:** Catani-Seymour dipole subtraction

Catani, Seymour (1996); Catani, Dittmaier, Seymour, Trocsanyi (2002)

$p_1 p_2 \rightarrow ZZ p_3 p_4$ : 21 subprocesses, on avg. 6 dipoles per subprocess,  $\sim 1200$  Feynman graphs in total

Amplitude and subtraction terms:

Sherpa Gleisberg, Krauss (2007) and MadGraph Stelzer et al. (1994) + MadDipole Frederix, Gehrmann, Greiner (2008); 2nd cross check: Helac dipoles Czakon, Papadopoulos, Worek (2009)

**2→4 status:** complete and cross checked (9 digit agreement for  $|\mathcal{M}_R|^2$  and all dipoles)

# Tuned comparison with DKU's calculation

T. Binoth, T. Gleisberg, S. Karg, NK, G. Sanguinetti and S. Dittmaier, S. Kallweit, P. Uwer

Compare results for one phase space (PS) point and PS-integrated results.

Exactly the same setup is required!

Selected PS configuration: four-momenta  $p = (E, p_x, p_y, p_z)$  [GeV] with  $1, 2 \rightarrow 3, 4, 5$ :

$$p_1^\mu = (250, 0, 0, 250), \quad p_2^\mu = (250, 0, 0, -250),$$

$$p_3^\mu = (125.9335600344245, -81.91900733932759, -15.22986911133704, -24.52218428963296),$$

$$p_4^\mu = (201.2131630027446, 37.57875773939030, -105.1640094872687, 140.3561672919824),$$

$$p_5^\mu = (172.8532769628309, 44.34024959993729, 120.3938785986057, -115.8339830023494),$$

## Complete specification of results:

The following results essentially employ the setup of Binoth et al. The CTEQ6 set of parton distribution functions (PDFs) is used throughout, i.e. CTEQ6L1 PDFs with a 1-loop running  $\alpha_s$  are taken in LO and CTEQ6M PDFs with a 2-loop running  $\alpha_s$  in NLO. In the strong coupling constant the number of active flavours is  $N_f = 5$ , and we use the default LHAPDF values leading to  $\alpha_s^{\text{LO}}(91.188 \text{ GeV}) = 0.129783$  and  $\alpha_s^{\text{NLO}}(91.70 \text{ GeV}) = 0.1179$ . The top-quark loop in the gluon self-energy is subtracted at zero momentum. The running of  $\alpha_s$  is, thus, generated solely by the contributions of the light quark and gluon loops. In all results shown in the following, the renormalization and factorization scales are set to  $M_Z$ . The top-quark mass is  $m_t = 174.3 \text{ GeV}$ , the masses of all other quarks are neglected. The weak boson masses are  $M_Z = 91.188 \text{ GeV}$  and  $M_H = 150 \text{ GeV}$ . The weak mixing angle is set to its on-shell value, i.e. fixed by  $s_w^2 = 0.222247$ , and the electromagnetic coupling constant is set to  $\alpha = 0.00755391226$ . We apply the  $k_\perp$  jet algorithm with covariant  $E$ -recombination scheme and  $R = 0.7$  for the definition of the tagged hard jet and restrict the transverse momentum of the hardest jet by  $p_{T,\text{jet}} > 50 \text{ GeV}$ .

# Summary

- ▶  $pp \rightarrow ZZ + \text{jet}$  @ NLO needed to predict  $ZZ$  (+ jet) LHC backgrounds and control theoretical uncertainty
- ▶  $pp \rightarrow ZZ + \text{jet}$  @ NLO is component of  $pp \rightarrow ZZ$  @ NNLO
- ▶ NLO  $ZZ + \text{jet}$  calculation using Golem/Catani-Seymour methods and Golem/Sherpa implementation
- ▶ successful detailed comparison with DKU's calculation
- ▶ essential: differential description of  $K$  factor and scale uncertainty
- ▶ selection cuts (e.g. jet veto) can strongly affect  $K$  factor and uncertainty
- ▶ selection cuts can reduce LO-type contributions at NLO and hence improve the NLO uncertainty
